27.2	Properties of circles	278			
27.3	Radians and degrees	280			
27.4	Arc length and area of circles and sectors	281			
27.5	The equation of a circle	285			
Revision Test 10		287			
28	Volumes and surface areas of common solids	289			
28.1	Introduction	289			
28.2	Volumes and surface areas of common shapes	289			
28.3	Summary of volumes and surface areas of common solids	296			
28.4	More complex volumes and surface areas	296			
28.5	Volumes and surface areas of frusta of pyramids and cones	302			
28.6	Volumes of similar shapes	306			
29	Irregular areas and volumes and mean values	307			
29.1	Areas of irregular figures	307			
29.2	Volumes of irregular solids	310			
29.3	Mean or average values of waveforms	311			
Revision Test 11		315			
30	Vectors	317			
30.1	Introduction	317			
30.2	Scalars and vectors	317			
30.3	Drawing a vector	318			
30.4	Addition of vectors by drawing	319			
30.5	Resolving vectors into horizontal and vertical components	321			
30.6	Addition of vectors by calculation	322			
30.7	Vector subtraction	326			
30.8	Relative velocity	327			
30.9	i , j and k notation	328			
31	Methods of adding alternating waveforms	330			
31.1	Combining two periodic functions	330			
31.2	Plotting periodic functions	331			
31.3	Determining resultant phasors by drawing	332			
31.4	Determining resultant phasors by the sine and cosine rules	334			
31.5	Determining resultant phasors by horizontal and vertical components	335			
Revision Test 12		338			
Multiple choice questions Test 4		340			
32	Presentation of statistical data	343			
32.1	Some statistical terminology	344			
32.2	Presentation of ungrouped data	345			
32.3	Presentation of grouped data	348			
33	Mean, median, mode and standard deviation	355			
33.1	Measures of central tendency	355			
33.2	Mean, median and mode for discrete data	356			
33.3	Mean, median and mode for grouped data	357			
33.4	Standard deviation	358			
33.5	Quartiles, deciles and percentiles	360			
34	Probability	362			
34.1	Introduction to probability	363			
34.2	Laws of probability	364			
Revision Test 13		369			
Multiple choice questions Test 5		370			

35 Introduction to differentiation	372		
35.1 Introduction to calculus	372	37.3 Arithmetic progressions	405
35.2 Functional notation	372	37.4 Geometric progressions	408
35.3 The gradient of a curve	373	38 Binary, octal and hexadecimal numbers	412
35.4 Differentiation from first principles	374	38.1 Introduction	412
35.5 Differentiation of $y = ax^n$ by the general rule	375	38.2 Binary numbers	413
35.6 Differentiation of sine and cosine functions	378	38.3 Octal numbers	416
35.7 Differentiation of e^{ax} and $\ln ax$	380	38.4 Hexadecimal numbers	419
35.8 Summary of standard derivatives	381	39 Inequalities	423
35.9 Successive differentiation	382	39.1 Introduction to inequalities	423
35.10 Rates of change	382	39.2 Simple inequalities	424
35.11 Differentiation of a product	384	39.3 Inequalities involving a modulus	424
35.12 Differentiation of a quotient	385	39.4 Inequalities involving quotients	425
35.13 Function of a function	386	39.5 Inequalities involving square functions	426
36 Standard integration	388	39.6 Quadratic inequalities	427
36.1 The process of integration	388	Revision Test 15	430
36.2 The general solution of integrals of the form ax^n	389	Multiple choice questions Test 7	431
36.3 Standard integrals	389	List of formulae	432
36.4 Definite integrals	392	Answers to Practice Exercises	436
36.5 The area under a curve	394	Answers to multiple choice questions	455

37.2 The n th term of a series	404		

Preface

Basic Engineering Mathematics, 7th Edition introduces and then consolidates basic mathematical principles and promotes awareness of mathematical concepts for students needing a broad base for further vocational studies. In this seventh edition, new material has been added on metric conversions, metric to imperial conversions, numbering systems, comparing numerical methods, further differentiation methods, together with other minor modifications.

The text covers:

- (i) **Basic mathematics** for a wide range of introductory/access/foundation mathematics courses
- (ii) **‘Mathematics for Engineering Technicians’** for BTEC First NQF Level 2; *chapters 1 to 12, 16 to 18, 21, 22, 24, and 26 to 28 are needed for this module.*
- (iii) The mandatory **‘Mathematics for Technicians’** for BTEC National Certificate and National Diploma in Engineering, NQF Level 3; *chapters 7 to 10, 14 to 17, 19, 21 to 24, 26 to 28, 32, 33, 35 and 36 are needed for this module. In addition, chapters 1 to 6, 11 and 12 are helpful revision for this module.*
- (iv) **GCSE revision**, and for similar mathematics courses in English-speaking countries worldwide.

Basic Engineering Mathematics, 7th Edition provides a lead into *Engineering Mathematics, 8th Edition*.

Each topic considered in the text is presented in a way that assumes in the reader little previous knowledge of that topic.

Theory is introduced in each chapter by an outline of essential theory, definitions, formulae, laws and

procedures. However, these are kept to a minimum, for problem solving is extensively used to establish and exemplify the theory. It is intended that readers will gain real understanding through seeing problems solved and then solving similar problems themselves.

This textbook contains over **800 worked problems**, followed by some **1,600 further problems** (all with answers – at the end of the book). The further problems are contained within **168 Practise Exercises**; each Practise Exercise follows on directly from the relevant section of work. **Fully worked solutions to all 1,600 problems have been made freely available to all via the website** – see page xii. **425 line diagrams** enhance the understanding of the theory. Where at all possible the problems mirror potential practical situations found in engineering and science.

At regular intervals throughout the text are **15 Revision Tests** to check understanding. For example, Revision Test 1 covers material contained in *chapters 1* and *2*, Revision Test 2 covers the material contained in *chapters 3* to *5*, and so on. These Revision Tests do not have answers given since it is envisaged that lecturers/instructors could set the Tests for students to attempt as part of their course structure. Lecturers/instructors may obtain solutions to the Revision Tests online – see page xii.

At the end of the book a list of relevant **formulae** contained within the text is included for convenience of reference.

‘Learning by Example’ is at the heart of *Basic Engineering Mathematics, 7th Edition*.

JOHN BIRD
Royal Naval Defence College of Marine and Air
Engineering, HMS Sultan,
formerly of University of Portsmouth
and Highbury College, Portsmouth

Free Web downloads at
www.routledge.com/cw/bird

For students

1. **Full solutions** to the 1,600 questions contained in the 168 Practice Exercises
2. Download **multiple choice questions and answer sheet**
3. **List of essential formulae**
4. **Famous engineers/scientists** – From time to time in the text, 18 famous mathematicians/engineers are referred to and emphasised with an asterisk*. Background information on each of these is available via the website. Mathematicians/engineers involved are: **Boyle, Celsius, Charles, Descartes, Faraday, Henry, Hertz, Hooke, Kirchhoff, Leibniz, Morland, Napier, Newton, Ohm, Pascal, Pythagoras, Simpson and Young.**

For instructors/lecturers

1. **Full solutions** to the 1,600 questions contained in the 168 Practice Exercises
2. **Full solutions** and marking scheme to each of the **15 Revision Tests**
3. **Revision Tests** – available to run off to be given to students
4. Download **multiple choice questions and answer sheet**
5. **List of essential formulae**
6. **Illustrations** – all 425 available on PowerPoint
7. **Famous engineers/scientists** – 18 are mentioned in the text, as listed previously.

Chapter 1

Basic arithmetic

Why it is important to understand: Basic arithmetic

Being numerate, i.e. having an ability to add, subtract, multiply and divide whole numbers with some confidence, goes a long way towards helping you become competent at mathematics. Of course electronic calculators are a marvellous aid to the quite complicated calculations often required in engineering; however, having a feel for numbers ‘in our head’ can be invaluable when estimating. Do not spend too much time on this chapter because we deal with the calculator later; however, try to have some idea how to do quick calculations in the absence of a calculator. You will feel more confident in dealing with numbers and calculations if you can do this.

At the end of this chapter you should be able to:

- understand positive and negative integers
- add and subtract integers
- multiply and divide two integers
- multiply numbers up to 12×12 by rote
- determine the highest common factor from a set of numbers
- determine the lowest common multiple from a set of numbers
- appreciate the order of operation when evaluating expressions
- understand the use of brackets in expressions
- evaluate expressions containing $+$, $-$, \times , \div and brackets

1.1 Introduction

Whole numbers

Whole Numbers are simply the numbers **0, 1, 2, 3, 4, 5, ...**

Counting numbers

Counting Numbers are whole numbers, but **without the zero**, i.e. **1, 2, 3, 4, 5, ...**

Natural numbers

Natural Numbers can mean either counting numbers or whole numbers.

Integers

Integers are like whole numbers, but they **also include negative numbers**.

Examples of integers include ... $-5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, \dots$

Arithmetic operators

The four basic arithmetic operators are add ($+$), subtract ($-$), multiply (\times) and divide (\div).

It is assumed that adding, subtracting, multiplying and dividing reasonably small numbers can be achieved without a calculator. However, if revision of this area is needed then some worked problems are included in the following sections.

When **unlike signs** occur together in a calculation, the overall sign is **negative**. For example,

$$3 + (-4) = 3 + -4 = 3 - 4 = -1$$

2 Basic Engineering Mathematics

and

$$(+5) \times (-2) = -10$$

Like signs together give an overall **positive sign**. For example,

$$3 - (-4) = 3 - -4 = 3 + 4 = 7$$

and

$$(-6) \times (-4) = +24$$

Prime numbers

A prime number can be divided, without a remainder, only by itself and by 1. For example, 17 can be divided only by 17 and by 1. Other examples of prime numbers are 2, 3, 5, 7, 11, 13, 19 and 23.

1.2 Revision of addition and subtraction

You can probably already add two or more numbers together and subtract one number from another. However, if you need revision then the following worked problems should be helpful.

Problem 1. Determine $735 + 167$

$$\begin{array}{r} \text{H T U} \\ 735 \\ + 167 \\ \hline 902 \\ 11 \end{array}$$

- (i) $5 + 7 = 12$. Place 2 in units (U) column. Carry 1 in the tens (T) column.
- (ii) $3 + 6 + 1$ (carried) $= 10$. Place the 0 in the tens column. Carry the 1 in the hundreds (H) column.
- (iii) $7 + 1 + 1$ (carried) $= 9$. Place the 9 in the hundreds column.

Hence, $735 + 167 = 902$

Problem 2. Determine $632 - 369$

$$\begin{array}{r} \text{H T U} \\ 632 \\ - 369 \\ \hline 263 \end{array}$$

- (i) $2 - 9$ is not possible; therefore change one ten into ten units (leaving 2 in the tens column). In the units column, this gives us $12 - 9 = 3$

- (ii) Place 3 in the units column.

- (iii) $2 - 6$ is not possible; therefore change one hundred into ten tens (leaving 5 in the hundreds column). In the tens column, this gives us $12 - 6 = 6$

- (iv) Place the 6 in the tens column.

- (v) $5 - 3 = 2$

- (vi) Place the 2 in the hundreds column.

Hence, $632 - 369 = 263$

Problem 3. Add 27, -74 , 81 and -19

This problem is written as $27 - 74 + 81 - 19$.

Adding the positive integers:	27
	81
Sum of positive integers is	108
Adding the negative integers:	74
	19
Sum of negative integers is	93
Taking the sum of the negative integers from the sum of the positive integers gives	108
	-93
	15

Thus, $27 - 74 + 81 - 19 = 15$

Problem 4. Subtract -74 from 377

This problem is written as $377 - -74$. Like signs together give an overall positive sign, hence

$$\begin{array}{r} 377 - -74 = 377 + 74 \\ 377 \\ + 74 \\ \hline 451 \end{array}$$

Thus, $377 - -74 = 451$

Problem 5. Subtract 243 from 126

The problem is $126 - 243$. When the second number is larger than the first, take the smaller number from the larger and make the result negative. Thus,

$$\begin{array}{r} 126 - 243 = -(243 - 126) \\ 243 \\ - 126 \\ \hline 117 \end{array}$$

Thus, $126 - 243 = -117$

Problem 6. Subtract 318 from -269

The problem is $-269 - 318$. The sum of the negative integers is

$$\begin{array}{r} 269 \\ + 318 \\ \hline 587 \end{array}$$

Thus, $-269 - 318 = -587$

Now try the following Practice Exercise

Practice Exercise 1 Further problems on addition and subtraction (answers on page 436)

In Problems 1–15, determine the values of the expressions given, without using a calculator.

- $67 \text{ kg} - 82 \text{ kg} + 34 \text{ kg}$
- $73 \text{ m} - 57 \text{ m}$
- $851 \text{ mm} - 372 \text{ mm}$
- $124 - 273 + 481 - 398$
- $£927 - £114 + £182 - £183 - £247$
- $647 - 872$
- $2417 - 487 + 2424 - 1778 - 4712$
- $-38419 - 2177 + 2440 - 799 + 2834$
- $£2715 - £18250 + £11471 - £1509 + £113274$
- $47 + (-74) - (-23)$
- $813 - (-674)$
- $3151 - (-2763)$
- $4872 \text{ g} - 4683 \text{ g}$
- $-23148 - 47724$
- $\$53774 - \38441
- Calculate the diameter d and dimensions A and B for the template shown in Fig. 1.1. All dimensions are in millimetres.

Figure 1.1

1.3 Revision of multiplication and division

You can probably already multiply two numbers together and divide one number by another. However, if you need a revision then the following worked problems should be helpful.

Problem 7. Determine 86×7

$$\begin{array}{r} \text{H T U} \\ 86 \\ \times 7 \\ \hline 602 \\ \hline 4 \end{array}$$

- $7 \times 6 = 42$. Place the 2 in the units (U) column and 'carry' the 4 into the tens (T) column.
- $7 \times 8 = 56$; $56 + 4$ (carried) = 60. Place the 0 in the tens column and the 6 in the hundreds (H) column.

Hence, $86 \times 7 = 602$

A good grasp of **multiplication tables** is needed when multiplying such numbers; a reminder of the multiplication table up to 12×12 is shown below. Confidence with handling numbers will be greatly improved if this table is memorised.

Multiplication table

×	2	3	4	5	6	7	8	9	10	11	12
2	4	6	8	10	12	14	16	18	20	22	24
3	6	9	12	15	18	21	24	27	30	33	36
4	8	12	16	20	24	28	32	36	40	44	48
5	10	15	20	25	30	35	40	45	50	55	60
6	12	18	24	30	36	42	48	54	60	66	72
7	14	21	28	35	42	49	56	63	70	77	84
8	16	24	32	40	48	56	64	72	80	88	96
9	18	27	36	45	54	63	72	81	90	99	108
10	20	30	40	50	60	70	80	90	100	110	120
11	22	33	44	55	66	77	88	99	110	121	132
12	24	36	48	60	72	84	96	108	120	132	144

Problem 8. Determine 764×38

$$\begin{array}{r}
 764 \\
 \times 38 \\
 \hline
 6112 \\
 22920 \\
 \hline
 29032
 \end{array}$$

- (i) $8 \times 4 = 32$. Place the 2 in the units column and carry 3 into the tens column.
- (ii) $8 \times 6 = 48$; $48 + 3$ (carried) = 51. Place the 1 in the tens column and carry the 5 into the hundreds column.
- (iii) $8 \times 7 = 56$; $56 + 5$ (carried) = 61. Place 1 in the hundreds column and 6 in the thousands column.
- (iv) Place 0 in the units column under the 2
- (v) $3 \times 4 = 12$. Place the 2 in the tens column and carry 1 into the hundreds column.
- (vi) $3 \times 6 = 18$; $18 + 1$ (carried) = 19. Place the 9 in the hundreds column and carry the 1 into the thousands column.
- (vii) $3 \times 7 = 21$; $21 + 1$ (carried) = 22. Place 2 in the thousands column and 2 in the ten thousands column.
- (viii) $6112 + 22920 = 29032$

Hence, $764 \times 38 = 29032$

Again, knowing multiplication tables is rather important when multiplying such numbers.

It is appreciated, of course, that such a multiplication can, and probably will, be performed using a **calculator**. However, there are times when a calculator may not be available and it is then useful to be able to calculate the 'long way'.

Problem 9. Multiply 178 by -46

When the numbers have different signs, the result will be negative. (With this in mind, the problem can now be solved by multiplying 178 by 46.) Following the procedure of Problem 8 gives

$$\begin{array}{r}
 178 \\
 \times 46 \\
 \hline
 1068 \\
 7120 \\
 \hline
 8188
 \end{array}$$

Thus, $178 \times 46 = 8188$ and $178 \times (-46) = -8188$

Problem 10. Determine $1834 \div 7$

$$\begin{array}{r}
 262 \\
 7 \overline{)1834}
 \end{array}$$

- (i) 7 into 18 goes 2, remainder 4. Place the 2 above the 8 of 1834 and carry the 4 remainder to the next digit on the right, making it 43
- (ii) 7 into 43 goes 6, remainder 1. Place the 6 above the 3 of 1834 and carry the 1 remainder to the next digit on the right, making it 14
- (iii) 7 into 14 goes 2, remainder 0. Place 2 above the 4 of 1834

$$\text{Hence, } 1834 \div 7 = 1834/7 = \frac{1834}{7} = 262$$

The method shown is called **short division**.

Problem 11. Determine $5796 \div 12$

$$\begin{array}{r} 483 \\ 12 \overline{)5796} \\ \underline{48} \\ 99 \\ \underline{96} \\ 36 \\ \underline{36} \\ 00 \end{array}$$

- (i) 12 into 5 won't go. 12 into 57 goes 4; place 4 above the 7 of 5796
- (ii) $4 \times 12 = 48$; place the 48 below the 57 of 5796
- (iii) $57 - 48 = 9$
- (iv) Bring down the 9 of 5796 to give 99
- (v) 12 into 99 goes 8; place 8 above the 9 of 5796
- (vi) $8 \times 12 = 96$; place 96 below the 99
- (vii) $99 - 96 = 3$
- (viii) Bring down the 6 of 5796 to give 36
- (ix) 12 into 36 goes 3 exactly.
- (x) Place the 3 above the final 6
- (xi) $3 \times 12 = 36$; Place the 36 below the 36
- (xii) $36 - 36 = 0$

$$\text{Hence, } 5796 \div 12 = 5796/12 = \frac{5796}{12} = 483$$

The method shown is called **long division**.

Now try the following Practice Exercise

Practice Exercise 2 Further problems on multiplication and division (answers on page 436)

Determine the values of the expressions given in Problems 1 to 9, without using a calculator.

- (a) 78×6 (b) 124×7
- (a) $\text{£}261 \times 7$ (b) $\text{£}462 \times 9$
- (a) $783 \text{ kg} \times 11$ (b) $73 \text{ kg} \times 8$
- (a) $27 \text{ mm} \times 13$ (b) $77 \text{ mm} \times 12$
- (a) 448×23 (b) $143 \times (-31)$
- (a) $288 \text{ m} \div 6$ (b) $979 \text{ m} \div 11$
- (a) $\frac{1813}{7}$ (b) $\frac{896}{16}$
- (a) $\frac{21424}{13}$ (b) $15900 \div -15$
- (a) $\frac{88737}{11}$ (b) $46858 \div 14$
- A screw has a mass of 15 grams. Calculate, in kilograms, the mass of 1200 such screws ($1 \text{ kg} = 1000 \text{ g}$).
- Holes are drilled 35.7 mm apart in a metal plate. If a row of 26 holes is drilled, determine the distance, in centimetres, between the centres of the first and last holes.
- A builder needs to clear a site of bricks and top soil. The total weight to be removed is 696 tonnes. Trucks can carry a maximum load of 24 tonnes. Determine the number of truck loads needed to clear the site.

1.4 Highest common factors and lowest common multiples

When two or more numbers are multiplied together, the individual numbers are called **factors**. Thus, a factor is a number which divides into another number exactly. The **highest common factor (HCF)** is the largest number which divides into two or more numbers exactly. For example, consider the numbers 12 and 15. The factors of 12 are 1, 2, 3, 4, 6 and 12 (i.e. all the numbers that divide into 12).

6 Basic Engineering Mathematics

The factors of 15 are 1, 3, 5 and 15 (i.e. all the numbers that divide into 15).

1 and 3 are the only **common factors**; i.e. numbers which are factors of **both** 12 and 15

Hence, **the HCF of 12 and 15 is 3** since 3 is the highest number which divides into **both** 12 and 15

A **multiple** is a number which contains another number an exact number of times. The smallest number which is exactly divisible by each of two or more numbers is called the **lowest common multiple (LCM)**.

For example, the multiples of 12 are 12, 24, 36, 48, 60, 72, ... and the multiples of 15 are 15, 30, 45, 60, 75, ...

60 is a common multiple (i.e. a multiple of **both** 12 and 15) and there are no lower common multiples.

Hence, **the LCM of 12 and 15 is 60** since 60 is the lowest number that both 12 and 15 divide into.

Here are some further problems involving the determination of HCFs and LCMs.

Problem 12. Determine the HCF of the numbers 12, 30 and 42

Probably the simplest way of determining an HCF is to express each number in terms of its lowest factors. This is achieved by repeatedly dividing by the prime numbers 2, 3, 5, 7, 11, 13, ... (where possible) in turn. Thus,

$$\begin{array}{l} 12 = 2 \times 2 \times 3 \\ 30 = 2 \times 3 \times 5 \\ 42 = 2 \times 3 \times 7 \end{array}$$

The factors which are common to each of the numbers are 2 in column 1 and 3 in column 3, shown by the broken lines. Hence, **the HCF is 2×3** ; i.e. 6. That is, 6 is the largest number which will divide into 12, 30 and 42.

Problem 13. Determine the HCF of the numbers 30, 105, 210 and 1155

Using the method shown in Problem 12:

$$\begin{array}{l} 30 = 2 \times 3 \times 5 \\ 105 = 3 \times 5 \times 7 \\ 210 = 2 \times 3 \times 5 \times 7 \\ 1155 = 3 \times 5 \times 7 \times 11 \end{array}$$

The factors which are common to each of the numbers are 3 in column 2 and 5 in column 3. Hence, **the HCF is $3 \times 5 = 15$**

Problem 14. Determine the LCM of the numbers 12, 42 and 90

The LCM is obtained by finding the lowest factors of each of the numbers, as shown in Problems 12 and 13 above, and then selecting the largest group of any of the factors present. Thus,

$$\begin{array}{l} 12 = 2 \times 2 \times 3 \\ 42 = 2 \times 3 \times 7 \\ 90 = 2 \times 3 \times 3 \times 5 \end{array}$$

The largest group of any of the factors present is shown by the broken lines and is 2×2 in 12, 3×3 in 90, 5 in 90 and 7 in 42

Hence, **the LCM is $2 \times 2 \times 3 \times 3 \times 5 \times 7 = 1260$** and is the smallest number which 12, 42 and 90 will all divide into exactly.

Problem 15. Determine the LCM of the numbers 150, 210, 735 and 1365

Using the method shown in Problem 14 above:

$$\begin{array}{l} 150 = 2 \times 3 \times 5 \times 5 \\ 210 = 2 \times 3 \times 5 \times 7 \\ 735 = 3 \times 5 \times 7 \times 7 \\ 1365 = 3 \times 5 \times 7 \times 13 \end{array}$$

Hence, **the LCM is $2 \times 3 \times 5 \times 5 \times 7 \times 7 \times 13 = 95550$**

Now try the following Practice Exercise

Practice Exercise 3 Further problems on highest common factors and lowest common multiples (answers on page 436)

Find (a) the HCF and (b) the LCM of the following groups of numbers.

- 8, 12
- 60, 72
- 50, 70
- 270, 900
- 6, 10, 14
- 12, 30, 45

7. 10, 15, 70, 105 8. 90, 105, 300
 9. 196, 210, 462, 910 10. 196, 350, 770

1.5 Order of operation and brackets

1.5.1 Order of operation

Sometimes addition, subtraction, multiplication, division, powers and brackets may all be involved in a calculation. For example,

$$5 - 3 \times 4 + 24 \div (3 + 5) - 3^2$$

This is an extreme example but will demonstrate the order that is necessary when evaluating.

When we read, we read from left to right. However, with mathematics there is a definite order of precedence which we need to adhere to. The order is as follows:

Brackets
Order (or pOwer)
Division
Multiplication
Addition
Subtraction

Notice that the first letters of each word spell **BODMAS**, a handy aide-mémoire. **Order** means **pOwer**. For example, $4^2 = 4 \times 4 = 16$

$5 - 3 \times 4 + 24 \div (3 + 5) - 3^2$ is evaluated as follows:

$$\begin{aligned} 5 - 3 \times 4 + 24 \div (3 + 5) - 3^2 \\ &= 5 - 3 \times 4 + 24 \div 8 - 3^2 \quad (\text{Bracket is removed and } 3 + 5 \text{ replaced with } 8) \\ &= 5 - 3 \times 4 + 24 \div 8 - 9 \quad (\text{Order means pOwer; in this case, } 3^2 = 3 \times 3 = 9) \\ &= 5 - 3 \times 4 + 3 - 9 \quad (\text{Division: } 24 \div 8 = 3) \\ &= 5 - 12 + 3 - 9 \quad (\text{Multiplication: } -3 \times 4 = -12) \\ &= 8 - 12 - 9 \quad (\text{Addition: } 5 + 3 = 8) \\ &= -13 \quad (\text{Subtraction: } 8 - 12 - 9 = -13) \end{aligned}$$

In practice, it does not matter if multiplication is performed before division or if subtraction is performed before addition. What is important is that the process of multiplication and division must be completed before addition and subtraction.

1.5.2 Brackets and operators

The basic laws governing the **use of brackets and operators** are shown by the following examples.

- (a) $2 + 3 = 3 + 2$; i.e. the order of numbers when adding does not matter.
 (b) $2 \times 3 = 3 \times 2$; i.e. the order of numbers when multiplying does not matter.
 (c) $2 + (3 + 4) = (2 + 3) + 4$; i.e. the use of brackets when adding does not affect the result.
 (d) $2 \times (3 \times 4) = (2 \times 3) \times 4$; i.e. the use of brackets when multiplying does not affect the result.
 (e) $2 \times (3 + 4) = 2(3 + 4) = 2 \times 3 + 2 \times 4$; i.e. a number placed outside of a bracket indicates that the whole contents of the bracket must be multiplied by that number.
 (f) $(2 + 3)(4 + 5) = (5)(9) = 5 \times 9 = 45$; i.e. adjacent brackets indicate multiplication.
 (g) $2[3 + (4 \times 5)] = 2[3 + 20] = 2 \times 23 = 46$; i.e. when an expression contains inner and outer brackets, **the inner brackets are removed first**.

Here are some further problems in which BODMAS needs to be used.

Problem 16. Find the value of $6 + 4 \div (5 - 3)$

The order of precedence of operations is remembered by the word BODMAS. Thus,

$$\begin{aligned} 6 + 4 \div (5 - 3) &= 6 + 4 \div 2 && \text{(Brackets)} \\ &= 6 + 2 && \text{(Division)} \\ &= 8 && \text{(Addition)} \end{aligned}$$

Problem 17. Determine the value of $13 - 2 \times 3 + 14 \div (2 + 5)$

$$\begin{aligned} 13 - 2 \times 3 + 14 \div (2 + 5) &= 13 - 2 \times 3 + 14 \div 7 && \text{(B)} \\ &= 13 - 2 \times 3 + 2 && \text{(D)} \\ &= 13 - 6 + 2 && \text{(M)} \\ &= 15 - 6 && \text{(A)} \\ &= 9 && \text{(S)} \end{aligned}$$

Problem 18. Evaluate

$$16 \div (2 + 6) + 18[3 + (4 \times 6) - 21]$$

$$\begin{aligned} 16 \div (2 + 6) + 18[3 + (4 \times 6) - 21] \\ &= 16 \div (2 + 6) + 18[3 + 24 - 21] \quad (\text{B: inner bracket} \\ &\quad \text{is determined first}) \\ &= 16 \div 8 + 18 \times 6 \quad (\text{B}) \\ &= 2 + 18 \times 6 \quad (\text{D}) \\ &= 2 + 108 \quad (\text{M}) \\ &= \mathbf{110} \quad (\text{A}) \end{aligned}$$

Note that a number outside of a bracket multiplies all that is inside the brackets. In this case,

$$18[3 + 24 - 21] = 18[6], \text{ which means } 18 \times 6 = 108$$

Problem 19. Find the value of

$$23 - 4(2 \times 7) + \frac{(144 \div 4)}{(14 - 8)}$$

$$\begin{aligned} 23 - 4(2 \times 7) + \frac{(144 \div 4)}{(14 - 8)} &= 23 - 4 \times 14 + \frac{36}{6} \quad (\text{B}) \\ &= 23 - 4 \times 14 + 6 \quad (\text{D}) \\ &= 23 - 56 + 6 \quad (\text{M}) \\ &= 29 - 56 \quad (\text{A}) \\ &= \mathbf{-27} \quad (\text{S}) \end{aligned}$$

Problem 20. Evaluate

$$\frac{3 + \sqrt{(5^2 - 3^2)} + 2^3}{1 + (4 \times 6) \div (3 \times 4)} + \frac{15 \div 3 + 2 \times 7 - 1}{3 \times \sqrt{4} + 8 - 3^2 + 1}$$

$$\begin{aligned} \frac{3 + \sqrt{(5^2 - 3^2)} + 2^3}{1 + (4 \times 6) \div (3 \times 4)} + \frac{15 \div 3 + 2 \times 7 - 1}{3 \times \sqrt{4} + 8 - 3^2 + 1} \\ &= \frac{3 + 4 + 8}{1 + 24 \div 12} + \frac{15 \div 3 + 2 \times 7 - 1}{3 \times 2 + 8 - 9 + 1} \\ &= \frac{3 + 4 + 8}{1 + 2} + \frac{5 + 2 \times 7 - 1}{3 \times 2 + 8 - 9 + 1} \end{aligned}$$

$$\begin{aligned} &= \frac{15}{3} + \frac{5 + 14 - 1}{6 + 8 - 9 + 1} \\ &= 5 + \frac{18}{6} \\ &= 5 + 3 = \mathbf{8} \end{aligned}$$

Now try the following Practice Exercise

Practice Exercise 4 Further problems on order of precedence and brackets (answers on page 436)

Evaluate the following expressions.

- $14 + 3 \times 15$
- $17 - 12 \div 4$
- $86 + 24 \div (14 - 2)$
- $7(23 - 18) \div (12 - 5)$
- $63 - 8(14 \div 2) + 26$
- $\frac{40}{5} - 42 \div 6 + (3 \times 7)$
- $\frac{(50 - 14)}{3} + 7(16 - 7) - 7$
- $\frac{(7 - 3)(1 - 6)}{4(11 - 6) \div (3 - 8)}$
- $\frac{(3 + 9 \times 6) \div 3 - 2 \div 2}{3 \times 6 + (4 - 9) - 3^2 + 5}$
- $\frac{(4 \times 3^2 + 24) \div 5 + 9 \times 3}{2 \times 3^2 - 15 \div 3} + \frac{2 + 27 \div 3 + 12 \div 2 - 3^2}{5 + (13 - 2 \times 5) - 4}$
- $\frac{1 + \sqrt{25} + 3 \times 2 - 8 \div 2}{3 \times 4 - \sqrt{(3^2 + 4^2)} + 1} - \frac{(4 \times 2 + 7 \times 2) \div 11}{\sqrt{9} + 12 \div 2 - 2^3}$

For fully worked solutions to each of the problems in Practice Exercises 1 to 4 in this chapter, go to the website:

www.routledge.com/cw/bird

Chapter 2

Fractions

Why it is important to understand: Fractions

Engineers use fractions all the time, examples including stress to strain ratios in mechanical engineering, chemical concentration ratios and reaction rates, and ratios in electrical equations to solve for current and voltage. Fractions are also used everywhere in science, from radioactive decay rates to statistical analysis. Calculators are able to handle calculations with fractions. However, there will be times when a quick calculation involving addition, subtraction, multiplication and division of fractions is needed. Again, do not spend too much time on this chapter because we deal with the calculator later; however, try to have some idea how to do quick calculations in the absence of a calculator. You will feel more confident to deal with fractions and calculations if you can do this.

At the end of this chapter you should be able to:

- understand the terminology numerator, denominator, proper and improper fractions and mixed numbers
- add and subtract fractions
- multiply and divide two fractions
- appreciate the order of operation when evaluating expressions involving fractions

2.1 Introduction

A mark of 9 out of 14 in an examination may be written as $\frac{9}{14}$ or 9/14. $\frac{9}{14}$ is an example of a fraction. The number above the line, i.e. 9, is called the **numerator**. The number below the line, i.e. 14, is called the **denominator**.

When the value of the numerator is less than the value of the denominator, the fraction is called a **proper fraction**. $\frac{9}{14}$ is an example of a proper fraction.

When the value of the numerator is greater than the value of the denominator, the fraction is called an **improper fraction**. $\frac{5}{2}$ is an example of an improper fraction.

A **mixed number** is a combination of a whole number and a fraction. $2\frac{1}{2}$ is an example of a mixed number. In

fact, $\frac{5}{2} = 2\frac{1}{2}$

There are a number of everyday examples in which fractions are readily referred to. For example, three people equally sharing a bar of chocolate would have $\frac{1}{3}$ each. A supermarket advertises $\frac{1}{5}$ off a six-pack of beer; if the beer normally costs £2 then it will now cost £1.60. $\frac{3}{4}$ of the employees of a company are women; if the company has 48 employees, then 36 are women.

Calculators are able to handle calculations with fractions. However, to understand a little more about fractions we will in this chapter show how to add, subtract,
